

## GVI workflow

Select drone + see data

Can then

ssh to drone  
upload to drone (scp)  
get data from drone  
show telemetry

show telemetry

Opens new window with stats

action, drone buttons

git pull + pulls from repo to always  
ensure updated files

Upload to all + scp's all drones in the  
vicinity (NVA)

Scan nearby drones + Uses some sort of  
if scanning + checking with onboard Flask  
program (NVA)

Getting Mac Address:

Send file which runs the MAC bash script  
Make bash script executable

Running it seems to be an issue as it cannot find  
I can run python files but not bash scripts  
Instead will tell Rpi to run the python script  
which runs the bash script...

Can run the script directly. Next will run just  
the command and then collect the output from the  
terminal
